SoD Review Tool — Demo Cheat Sheet

Oracle EBS · 10 minutes · demo data only

One file · offline · nothing leaves the laptop

SCRIPT

	DO	SAY
0:00	Tool open, nothing loaded	*"SoD checks are usually spreadsheets and responsibility names. This does it in minutes, at function level, and your data never leaves this laptop."*
1:00	—	*"Four steps: DBA runs two read-only queries → screen by responsibility → confirm by function → triage and report."*
1:45	Slot 1 `Demo_Oracle_Responsibilities` · slot 2 `Demo_Name_Mapping` · **Run review**	*"Recognised by columns, not sheet names. 19 users, 37 rows: **5 High**, **3 Medium**. Only names that clearly mean transactions count here."*
2:45	SoD tab → filter `JSMITH`, then `KPATEL`	*"John maintains suppliers and pays them. Kiran holds System Administrator — that sits under your admin policy, so it isn't flagged."*
3:45	Slot 1 `Demo_Oracle_Access_with_Functions` · **Run review**	*"Same extract plus functions. Level 3 = what people can actually do: 'Payables Manager' turns out to enter invoices and pay them — 11 conflicts only visible here."*
4:30	L3 tiles, then filter `PKUMAR`, then `VSINGH`	*"PKUMAR: Receiving is inquiry-only, so it's a false positive closed with evidence. VSINGH: one responsibility does invoices and payments, invisible to name checks."*
5:45	Mark one **True Positive**, one **False Positive**	*"Verdicts recorded here flow into both reports."*
6:15	**Unmatched** tab	*"System and admin accounts are excluded per your admin policy. Anything unlinked is listed, so nothing drops silently."*
7:00	**Rules** tab · slot 3 `Demo_Client_SoD_Matrix` · **Run review**	*"62 rules incl. every pair from Atlanta's published Oracle audit. Editable, or load yours: Critical goes 0 → 1."*
8:00	**Export Excel** + **Export Word report**, open both	*"Every finding with verdicts, plus the working paper ready for sign-off."*
9:00	Open `sql/SoD_Query_Stack.pdf`	*"Your DBA runs Q1 and Q2, read-only, two pages. Dry run on your data in week one."*

BEFORE THE CALL

1. `git pull` (demo files are in `demo/`)
2. Open `uar-tool.html` in Chrome/Edge (Wi-Fi can be off)
3. **Rules** → **Reset to defaults** so numbers match
4. Zoom 110–125%

NUMBERS ON SCREEN

Level 1	**19** users · **37** rows · **0** / **5** / **3** (C/H/M) · Unmatched **4**
Level 3	**7** confirmed · **1** not confirmed · **11** found only at L3 · High **14**
Client matrix	Critical **0** → **1** (JSMITH supplier × payments)
Rule set	**62** conflicts · **31** categories

IF THEY ASK

Does our data go anywhere? No. No network calls at all; works with Wi-Fi off.

How accurate? Names are only the screen; every finding is confirmed or rejected against real functions, shown as evidence.

Several entities? Conflicts only count within the same entity code in the responsibility name.

Our own rules? Yes: load your Excel matrix or edit in the tool.

Writes to Oracle? Never. Queries are SELECT-only, run by your DBA.

Fusion Cloud? Built for EBS; Fusion would be scoped separately.

DON'T

- Reload or close before exporting (verdicts are lost)
- Show another client's real extract: demo files only

CLOSE WITH

Share the 2-page query PDF → DBA runs Q1 (+ Q2) → dry run on full extract in week 1 → agree rule set with risk owner.
